

Tableau Dashboard — Story & Setup Guide

Day 5 of 7 — Perfume_Dashboard.twb

Important: Opening the Workbook

Perfume_Dashboard.twb is a live Tableau workbook (not a packaged .twbx), so it connects to perfume_sales.csv by relative path from Day-1_Dataset/. If Tableau shows a broken data-source icon when you open it, right-click the data source in the left pane, choose 'Edit Connection', and point it at your local copy of perfume_sales.csv. Dashboard_Screenshot.png shows what the finished dashboard looks like once connected, generated here as a static preview since this environment doesn't run Tableau Desktop directly.

Dashboard Contents

- **Revenue by City** — horizontal bar chart, top cities by revenue
- **Revenue by Brand** — bar chart, all 12 brands ranked by revenue
- **Monthly Revenue Trend** — line chart, Jan 2025 - Jun 2026
- **Delivery Status by Brand Tier** — stacked bar, colored by Delivery_Status
- **Payment Method Mix** — pie chart of the 5 payment methods
- 4 KPI cards at the top: Total Revenue, Total Orders, Average Order Value, Return Rate

The Story: What This Dashboard Tells Stakeholders

A Tableau 'story' isn't just charts — it's a narrative. Here's how to walk a stakeholder (or interviewer) through this dashboard in under 3 minutes.

Scene 1 — Where is the money coming from?

Start with Revenue by City. Metro cities (Bengaluru, Mumbai, Delhi) dominate, which validates continued marketing spend there — but also flags an opportunity: mid-tier cities like Jaipur and Pune show strong average order values relative to their size.

Scene 2 — Which brands actually drive the business?

Move to Revenue by Brand. Premium brands (Dior, Chanel, Versace) sit at the top on revenue despite lower order counts, while budget brands (Fogg, Wild Stone, Ajmal) drive volume but contribute proportionally less revenue. This is the classic margin-vs-volume story every retail analyst needs to be able to explain.

Scene 3 — When should inventory ramp up?

The Monthly Revenue Trend line makes the Diwali (Oct-Nov) and New Year (Dec-Jan) spikes impossible to miss. This is the single most actionable chart in the dashboard for the Inventory Planning team.

Scene 4 — Where is money being lost?

Delivery Status by Brand Tier shows premium perfumes returned noticeably more often than budget ones — a direct, quantified answer to the concern Customer Support raised in the original business problem statement.

Scene 5 — How are customers paying?

The Payment Method Mix pie confirms UPI's dominance, which should shape how checkout promotions and cashback offers are designed going forward.

How to Rebuild This From Scratch (Interview Practice)

- Connect to perfume_sales.csv via Data > New Data Source > Text File.
- Drag City to Rows, Total_Amount to Columns, and change the mark type to Bar.
- Create a calculated field for Brand Tier: IF [Brand] IN ('Dior','Chanel',...) THEN 'Premium' ELSEIF ... END.
- Build each chart as its own worksheet, then combine them on a new Dashboard using the Dashboard > New Dashboard menu and dragging each sheet into a grid layout.
- Add KPI cards using Text objects with quick table calculations (SUM, COUNTD, AVG).
