

Business Problem Statement

AromaKart Perfume Sales Analytics — Day 1 of 7

1. Company Background

AromaKart is a fictional Indian online perfume retailer selling 12 branded perfume houses — from budget names like Fogg and Wild Stone to luxury names like Dior and Chanel — across 18 major Indian cities. Over the past 18 months (Jan 2025 - Jun 2026), leadership has relied on gut feeling rather than data to plan inventory, discounts, and marketing campaigns.

2. The Problem

- **Unclear revenue drivers** — Management doesn't know which brands, cities, or customer segments actually drive profitable revenue versus which merely drive order volume.
- **Inefficient discounting** — Discounts are applied fairly uniformly across products, with no clear view of whether they are recovering their cost through higher volume.
- **Rising returns/cancellations on premium SKUs** — Customer support has flagged that premium perfumes seem to be returned more often, but this has never been quantified.

3. Project Objective

Build a full, end-to-end Sales Analytics project — from raw data to Excel, SQL, Python, and Tableau dashboards — that helps the Marketing, Inventory, and Finance teams answer: *Where is our revenue coming from, who are our best customers, which products/cities to double down on, and where are we losing money to returns and over-discounting?*

4. Stakeholders

- VP of E-commerce — wants a single source of truth for revenue performance
- Regional Marketing Managers — need city and seasonal demand patterns
- Inventory Planning team — needs to forecast stock ahead of demand spikes
- Finance / FP&A; — needs to quantify the cost of discounting and returns

5. Scope of Analysis

18 months of transactional order data (Jan 2025 - Jun 2026), covering 3,000 order lines across 18 cities, 12 brands, 27 products, and 5 payment methods. The analysis will be delivered progressively across 7 days: raw dataset, Excel dashboard, SQL querying, Python EDA, Tableau dashboard, a GitHub-ready write-up, and interview prep.
