

Project Summary

AromaKart Perfume Sales Analytics — One-Page Overview

Project

AromaKart Perfume Sales Analytics Dashboard — a 7-day, end-to-end Data Analyst portfolio project covering Excel, SQL, Python, and Tableau.

Business Problem

AromaKart, a fictional Indian online perfume retailer, had no data-backed view of which brands, cities, or customers drove profitable revenue, whether its discounting strategy was efficient, or why premium products seemed to be returned more often.

Dataset

3,000 order-line records spanning Jan 2025 - Jun 2026, across 18 cities, 12 brands, 27 products, and 5 payment methods. Fully synthetic but engineered to mirror real e-commerce patterns: seasonality, metro-city skew, repeat-buyer behavior, and a premium/budget pricing-volume trade-off.

Approach

Day	Deliverable	Skill Demonstrated
1	Dataset + business framing	Requirements gathering, data dictionary
2	Excel dashboard + pivots	Formulas, PivotTables, charting
3	SQL database + queries	Aggregation, CTEs, window-function reasoning
4	Python EDA notebook	Pandas, Matplotlib, data storytelling
5	Tableau dashboard	Multi-chart dashboard design, narrative
6	GitHub write-up	Technical communication, documentation
7	Interview prep + resume	Articulating impact to a non-technical audience

Top 5 Findings

- Revenue peaks sharply around Diwali (Oct-Nov) and New Year (Dec-Jan).
- Metro cities (Bengaluru, Mumbai, Delhi) lead in both revenue and order count.
- Premium brands earn more per order but sell in far lower volume than budget brands.
- Premium perfumes have a meaningfully higher return rate than budget perfumes.

- UPI is the dominant payment method, and repeat customers contribute a disproportionate share of total revenue.

Business Recommendation

Ramp inventory 4-6 weeks ahead of Diwali and New Year, invest further marketing spend in metro cities while testing targeted campaigns in high-AOV smaller cities, reduce blanket discounting on premium SKUs, and launch a loyalty program aimed at the top decile of repeat customers.
